## Profile

Economics graduate (First Class Honours) completing an MSc in Data Analytics, applying for the Graduate Data Analyst programme. Writes SQL and Python to automate recurring reports, built a Tableau dashboard for an operations manager's weekly site meeting, and is writing an MSc thesis on demand forecasting.

## Education

**MSc Data Analytics** Sep 2026 – Aug 2027 (expected)
*Shannon University* *Limerick, Ireland*

- Thesis (in progress): forecasting weekly retail demand from point-of-sale data.
- Modules: Data Management and SQL; Statistical Modelling; Data Visualisation; Machine Learning for Business; Analytics Consulting Project.

**BA Economics (Honours), First Class Honours (1.1)** Sep 2022 – May 2026
*Shannon University* *Limerick, Ireland*

- Modules: Econometrics (1.1); Statistics for Economists; Energy and Environmental Economics.

## Experience

**Data Intern** Jul 2025 – Sep 2025
*CityWorks Facilities* *Dublin, Ireland*

- Automated the weekly response-time report with SQL and a Python (pandas) script, cutting build time from about half a day to a few minutes; checked it against three past reports before switching.
- Wrote SQL against a maintenance-ticket database (about 40,000 tickets a year) to report service performance by site.
- Built a Tableau dashboard of response times for 12 sites for the main stakeholder, the operations manager, used in the weekly site meeting.
- Traced implausibly good response times at two sites to a data-quality fault: duplicate tickets from the logging form. Wrote a rule to flag them so the dashboard showed corrected figures, and passed the form issue to IT.

**Treasurer** Sep 2024 – May 2025
*Shannon University Economics Society* *Limerick, Ireland*

- Managed an annual budget of about €6,000 and reported spending to the committee each month; the year closed within budget.
- Secured two conference sponsors by pitching a one-page attendance plan to five local firms.

## Projects

**Public-transport fare elasticity** *(final-year project, graded 1.1) – Python, statsmodels, Git* 2025–26

- Combined two years of monthly ridership open data with fare and fuel-price series; estimated price elasticity of demand with OLS regression, controlling for season and fuel prices.
- Found demand inelastic (about $-0.3$); wrote up the method and its limits for a non-technical reader.

## Skills

**Data & programming:** SQL, Python (pandas, statsmodels), regression and statistical modelling, Git
**Data visualisation:** Tableau
**Languages:** English (native), Irish (conversational), French (B1)
**Work authorisation:** Irish citizen; no sponsorship required. Available from September 2027.
**Interests:** five-a-side football, sea swimming
